

Solar Power Scheduling and Market Operations

APX Services Help Solar Developers Cut Capital and Operating Costs

Solar Developers are at their best when they focus on their core competencies: site acquisition, site access, unit placement, and development. Should you be running market operations, scheduling, and settlement teams within your organization? There's no need for that distraction. And it's significantly more expensive to establish and manage those activities in-house.

APX services are more cost effective, because APX costs are spread across multiple clients and infrastructure is already in place. APX is efficient, proven, and the price is right.

Business Value

No need to invest in 24/7 market operations support.

No need to build, buy or maintain power scheduling and settlement systems. No capital cost to the project in these areas.

No need to install and maintain SCADA systems in ERCOT.

Avoid on-going technology costs associated with market rules changes and redesigns, as in California (MRTU) and Texas (Texas Nodal).

Enabling Solar Developers to focus on their core competencies: site access and development.

APX Services

Integrate weather forecasts with power scheduling tools.

Submit information on behalf of the solar project to the ISO, including schedules and resource information.

Create and submit required NERC tags and OASIS reservations.

Answer phones in the fully staffed 24/7 APX Operations Center for ISO and/or counter party contacts.

Provide accurate settlement statements, including estimation of ISO charges and settlement validation support.
